STAINLESS STEEL CROWNS

Stainless steel crowns are silver colored, prefabricated crowns used to restore mainly primary teeth. They are a long term temporary restoration. For our purposes they are permanent. They are used when

- 1) Considerable tooth structure is lost to decay.
- 2) A large filling would be prone to breakage.
- 2) A restoration after a pulpotomy is required.

To prevent damage to stainless steel crowns, please **DO NOT CHEW BUBBLE BUM, STICKY CANDY OR FRUIT ROLL UPS.**
